

Cardiovascular Disease Prevention and Control: Clinical Decision-Support Systems (CDSS)

Summary Evidence Tables

Non-RCTs focused on CVD Prevention from Bright et al. Review*

Study	Study and Sample Characteristics	CDSS Intervention Characteristics	Results	Applicability and Summary
<p>Study Authors (Year): Dorr, Wilcox, Donnelly, et al. (2005)</p> <p>Study Focus: Diabetes management</p> <p>Suitability of design: Greatest</p> <p>Quality of Execution: Fair (1 limitation)</p> <p>Limitations: <u>Interpretation of results:</u> contamination as control patients were seen in the same intervention clinic or similar clinics by the same physicians as intervention patients</p>	<p>Geographical location: Utah and Idaho</p> <p>Study dates: March 1, 2001 – September 30, 2002</p> <p>General setting: Non-academic</p> <p>Specific setting: - Outpatient</p> <p>Study design: Other design with concurrent comparison</p> <p>Duration of ongoing intervention: 4-18 months</p> <p>Sampling Frame (specify): <u>Individual HCP (N=11)</u> A total of 7 IHC (intermountain healthcare clinics) clinics augmented their services by installing care managers and adding specific information technology. Four clinics without care managers served as control sites. > MDs (N=450); throughout IHC), 65 physicians in 7 intervention clinics > Care managers (N=7)</p>	<p>Basic description of system: Care managers utilized information technology which provided access to patient information, reminders and structures for best practices and enabled virtual communication integrated within IHC EHR system. The CDSS alerted and reminded care managers of specific tasks to perform and reminders when patients were overdue for various diabetes tests and displayed who needed follow-up calls for missed tests and patients with high test values. Care managers were able to store and retrieve information specific to workflow.</p> <p>Evidence-based guidelines incorporated into CDSS: Chronic disease guidelines developed by IHC from national resources for diabetes and hyperlipidemia</p> <p>Other interventions delivered: team-based care</p> <p>Source/origin of system: NR</p> <p>Content: Objective(s): - Chronic disease management - Initiating discussion with patient</p>	<p>Recommended clinical test ordered/completed HbA1c testing completed if overdue <u>Baseline:</u> Comparison (n=4,470): NR Intervention (n=1,185): NR <u>F/U: 4-18m:</u> Comparison (n=4,470): NR Intervention (n=1,185): NR Odds ratio (95%CI): 1.49 (1.3, 1.71)</p> <p>LDL testing completed if overdue <u>Baseline:</u> Comparison (n=4,470): NR Intervention (n=1,185): NR <u>F/U: 4-18m:</u> Comparison (n=4,470): NR Intervention (n=1,185): NR Odds ratio (95%CI): 1.26 (1.02, 1.57)</p> <p>CVD risk factors Lipids Change in LDL (mg/dL) <u>Baseline: Mean (SD)</u> Comparison (n=4,470): 104.3 (33.2) Intervention (n=1,185): 102.8 (32.7)</p>	<p>Applicability: From this study, mainly to primary care providers and care managers working in a large health system with established EHRs enhanced with clinical information systems to provide alerts, reminders and virtual communication between team members. Applicable majority white, middle-aged (60 yrs.) patients with diabetes</p> <p>Summary: This study demonstrates a statistically significant improvement in adherence to diabetic guidelines when generalist care managers with enhanced computer support are involved in the care of people with diabetes. However, patients between the age of 20-29 or 80 years and older, higher risk patients, and those with an irregular testing history</p>

Study	Study and Sample Characteristics	CDSS Intervention Characteristics	Results	Applicability and Summary
<p>Possible contamination due to co-location of the intervention and control group + Analysis did not control for USPSTF guidelines and other recommendations changing during the intervention period+ study reported race for one population group (whites), but did not report for others</p>	<p>intervention: 2 months</p> <p>Sampling Frame (specify): <u>Satellite facility of a family medical center (N=7,700 patients):</u> Each of the three small teams within the center is staffed with 2-3 faculty members, a resident physician, and a fulltime physician assistant. Each team had dedicated nurses, medical assistants, and receptionists.</p> <p><u>Patients (N=2,655):</u> Established patients between the ages of 18-75, with visit during the last two years, were sampled. Of the 2,655 patients, 1,433 were in the intervention group and 1,222 in the control group.</p> <p><u>Clinicians (n=42)</u> Intervention and control groups both had 21 physicians. Clinicians were geographically divided into two teams, each with its own personnel, exam room, and waiting area. Each team was staffed by three small teams of 2-3 faculty members, a representative of each of the three residency class years, and a fulltime physician assistant.</p> <p>Unit of allocation (if applicable): Team</p> <p>User level of expertise/proficiency/training (specify):</p>	<p>reminder system was also available online.</p> <p>Evidence-based guidelines incorporated into CDSS (specify): USPSTF and the National Committee for Quality Assurance guidelines (were updated during the study period)</p> <p>Other interventions delivered: NR Source/origin of system: Can't Tell</p> <p>Content: Objective(s): - Lab test ordering - Preventive care</p> <p>Relationship to point of care: - Synchronous</p> <p>Response requirement: - NR (unclear whether response requirement)</p> <p>Information delivery: Delivery format: - Paper-based (during the study). At the end of the study, the CDSS was made available online.</p> <p>Delivery mode: - System-initiated ("push")</p> <p>Contextual factors/features influencing the implementation and use of CDSS included in CDSS: General System Features: Integration with charting or order entry system to support workflow integration</p> <p>Clinician-System Interaction Features: Automatic provision of decision support as part of clinician workflow + No need for additional</p>	<p>See Previous</p>	<p>white women with private health insurance seeking care in one of the facilities of the University of Washington Medical Centers</p> <p>Summary: This 4-month non- randomized study examining the effectiveness of a clinical reminder system (embedded in a pre-existing repository) resulted in a modest decrease in cholesterol screening activity for both the intervention and control groups. This could be due to the USPSTF changing its guidelines on cholesterol screening during the study period and recommending that young adults at low risk for ischemic heart disease not be screening for cholesterol. This updated recommendation while actively discussed among study providers was not incorporated into the CDS system during the study period. Additionally, mammography screening increased for the intervention group by 154 percent, and no effect was observed for fecal occult blood testing.</p>

<p>limitations)</p> <p>Limitations: <u>Description:</u> No race/ethnicity or SES data reported <u>Interpretation of results:</u> >10% difference between intervention and comparison group sample sizes</p>	<p>Study design: Other design with concurrent comparison</p> <p>Duration of ongoing intervention: 48 months</p> <p>Sampling Frame (specify): <u>Clinicians/practices/hospitals</u> - <u>Individual HCPs (N=18):</u> A total of 2 clinics from HealthPartners (a multispecialty medical group providing care to 175,000 adults in 18 clinics) were included in this study, one EMR intervention clinic and one comparison clinic (without EMR) > MDs: (N=4 to 5 per clinic) - <u>Patients (N=122):</u> patients meeting inclusion criteria were included: n=57 in the EHR (intervention) group and n=65 in the comparison clinic</p> <p>Unit of allocation (if applicable): Clinic</p> <p>User level of expertise/proficiency/training (specify): Providers in the EHR clinic received extensive formal and ongoing one-on-one support through Information Services at HealthPartners, with expert consultation from Epic (EHR developer) as needed. All clinical data were loaded from several previous years, and after EHR implementation, paper charts were no longer available</p>	<p>diabetic patients had blood pressures of $\geq 130/85$ mmHg, LDL levels of ≥ 130 mg/dL, HbA1c levels $\leq 8\%$ or no aspirin use if aged 40 years or older.</p> <p>Evidence-based guidelines incorporated into CDSS: Not specified but seems like standard American guidelines</p> <p>Other interventions delivered: Team-based care; Intervention clinic also participated in a multifaceted improvement strategy to enhance diabetes care including one-on-one phone counseling on weight management, physical activity, stress management, and smoking cessation; provider performance feedback; and ongoing provider education. All clinics in the medical group had access to physician-specific diabetes registries that were distributed quarterly in printed form, in-clinic diabetes teaching nurses for patient education, and a common diabetes clinical guideline developed regionally.</p> <p>Source/origin of system: - Commercially available</p> <p>Content: Objective(s): - Pharmacotherapy - Lab test ordering - Chronic disease management Relationship to point of care: - Synchronous Response requirement: - No response requirement</p> <p>Information delivery: Delivery format: - Integrated with EHR/CPOE</p>	<p>Number of LDL tests performed (per patient per year) <u>Baseline: Mean</u> Comparison (n=65): 0.49 Intervention (n=57): 0.54 <u>F/U: 48m.</u> Comparison (n=65): 0.92 Intervention (n=57): 1.45 Change in mean difference: +0.48 (p=0.19; f/u only)</p> <p>Prop. of patients with ≥ 2 HbA1c tests as recommended <u>Baseline: (%)</u> Comparison (n=65): 55.4 Intervention (n=57): 47.4 <u>F/U: 48m.</u> Comparison (n=65): 53.9 Intervention (n=57): 78.9 Absolute percentage point change: +33.0 pct pts (p=0.002; f/u only)</p> <p>Prop. of patients with ≥ 1 LDL tests as recommended <u>Baseline: (%)</u> Comparison (n=65): 46.2 Intervention (n=57): 42.1 <u>F/U: 4yrs.</u> Comparison (n=65): 72.3 Intervention (n=57): 84.2 Absolute percentage point change: +16.0 pct pts (p=0.12; f/u only)</p> <p>Prop. of patients with ≥ 2 HbA1c tests AND ≥ 1 LDL tests as recommended <u>Baseline: (%)</u> Comparison (n=65): 30.8 Intervention (n=57): 29.8</p>	<p>multifaceted improvement strategy to enhance diabetes care. Findings are applicable (albeit from this small sample size study) to community primary care practices with EMRs and CDS for middle-aged patients (60 years) receiving diabetes management with a Charlson comorbidity score <2.</p> <p>Summary: In this study, EHR use was associated with improved process of care for adults with diabetes. Patients who attended the EHR clinic had more HbA1c tests than patients in the comparison clinic, and more patients in the EHR clinic met recommended thresholds for HbA1c an LDL test frequency than did patients in the comparison clinic. There was no evidence however, that this change in process of care led to better glycemic control in the EHR clinic patients during the 4-year follow-up period. Minimal changes in A1c level could be due to the fact that A1c was already improving steadily for 4 years independent of EHR implementation. Of note, HbA1c levels in the EHR</p>

<p>throughout the paper. <u>Measurement:</u> Composite score for healthcare process outcomes was not validated</p> <p><u>Interpretation of results:</u> Recruitment rate < 20% + possible contamination as intervention and control physicians practiced within same clinic</p>	<p>Sampling Frame (specify): - <u>Patients (N=1102):</u> A total of 545 patients were randomized to the intervention and a total of 557 patients were randomized to the control group. Patients were randomized by physician in blocks of 6 - <u>Individual HCPs (N=18):</u> A total of 18 sites were included in the study</p> <p>Unit of allocation (if applicable): - Patient (stratified by physician in blocks of 6)</p> <p>User level of expertise/proficiency/training (specify): All included practices utilized EHRs so physicians have previous experience with general EHRs</p> <p>Patient Demographics (n=545): - <u>Age (mean):</u> 69.3 yrs. - <u>Gender</u> > Male: 46.8% > Female: 53.2% - <u>Race/Ethnicity:</u> NR - <u>Education:</u> > Elementary only: 6.6% > Secondary only: 35.4% > College or University: 48.6% > Postgraduate school: 8.6% > Unknown: 0.7% - <u>Smoking Status:</u> > Current smoker: 12.7% BMI (mean): 27.5</p>	<p>recommendations. CIIVT was shared by patients and their physicians and the targets were based on the latest prognostic evidence. Patients were also provided with color print versions of their tracker page more than a week before their next appointment with a suggestion to take it with them to their visit.</p> <p>Evidence-based guidelines incorporated into CDSS: Yes, targets based on the latest prognostic evidence but not specified</p> <p>Other interventions delivered: Intervention patients also had telephone access to a clinical resource person (a pharmacist or a nurse) who provided advice and served as a liaison with the physician. Source/origin of system: Locally developed Content: Objective(s): - Chronic disease management - Lab test ordering</p> <p>Relationship to point of care: - Synchronous:</p> <p>Response requirement: - NR (unclear whether response requirement)</p> <p>Information delivery: Delivery format: - Online access - Integrated with EHR/CPOE - Paper-based (patients were mailed a colored print version of their tracker page)</p> <p>Delivery mode:</p>	<p><u>Baseline: Mean (SD) - NR F/U: 12m</u> Comparison: (n= 557): 0.14 (1.22) Intervention (n= 545): 0.74 (1.32) Change in mean difference (95% CI): +0.61 (0.46 to 0.76) (P<0.001)</p> <p>Change in BMI PCS <u>Baseline: Mean (SD) - NR F/U: 12m</u> Comparison: (n= 557): 0.14 (0.98) Intervention (n= 545): 0.86 (1.38) Change in mean difference (95% CI): +0.71 (0.48 to 0.94) (p<0.001)</p> <p>Change in Exercise PCS <u>Baseline: Mean (SD) - NR F/U: 12m</u> Comparison: (n= 557): 0.05 (0.35) Intervention (n= 545): 0.96 (1.21) Change in mean difference (95% CI): +0.91 (0.67 to 1.14) (p<0.001)</p> <p>Change in Diet PCS <u>Baseline: Mean (SD) - NR F/U: 12m</u> Comparison: (n= 557): 0.03 (0.18) Intervention (n= 545): 0.91 (1.17) Change in mean difference (95% CI): +0.88 (0.62 to 1.14) (p<0.001) Change in Aspirin Therapy PCS</p>	<p>patients 55 years or older who are college graduates with at least one vascular risk factor (diabetes, hypercholesterolemia, hypertension, previous MI, angina, CAD, stroke, or vascular disease)</p> <p>Summary: A web-based individualized tracking advice and decision support system aimed at both providers and patients had a significantly greater improvement in mean process composite score for healthcare process outcomes. The clinical outcomes of blood pressure, cholesterol levels, BMI, exercise, diet, and psychosocial scores showed no significant difference between groups. Only prescribing of aspirin therapy improved (OR: 1.44, 95%CI: 1.07-1.94; p=0.02). For patients with diabetes, intervention patients had a significantly greater improvement in the recommended monitoring of hemoglobin A1c and urine albumin levels. However, neither value was significantly improved in the intervention compared to the control group.</p>

<p>Study Authors (Year): Rodbard, Schnell, Unger, et al. (2012)</p> <p>Study Focus: Diabetes management</p> <p>Exclusion reason(s): Limited quality of execution</p> <p>Suitability of design: Greatest</p> <p>Quality of Execution: Limited (5 limitations)</p> <p>Limitations: <u>Description:</u> Poor description of where the clinicians were located or the demographics of the patients in the case studies <u>Sampling:</u> 582 participants were assessed for eligibility but no information on the sampling universe. <u>Measurement:</u> Unclear what the time element was for measurement of process outcomes.</p>	<p>Geographical location: NR</p> <p>Study dates: NR</p> <p>General setting: Not specified but probably non-academic since clinicians involved in medical education of any sort were excluded.</p> <p>Specific setting: - Outpatient</p> <p>Study design: RCT</p> <p>Duration of ongoing intervention: Unclear. Described as a “2 month study” but no further details.</p> <p>Sampling Frame (specify): No details on sampling frame. Study states that 582 clinicians were assessed for eligibility and 288 were randomized into 4 groups; complete data from 222 was available for analysis. <u>Clinicians/practices/hospitals</u> - <u>Individual HCPs (n=222)</u> > MDs (note specialty, if any) > FP MDs = 85 (38.3%) > IM MDs = 87 (39.2%) > NPs = 50 (22.5%) - <u>Patients (N=30)</u></p>	<p>Basic description of system</p> <p>Intervention arm 1 (CDSS only): A blood glucose self-monitoring validated tool enabled patients to record and plot a seven-point SMBG profile (fasting, preprandial/2-h postprandial at each meal, bedtime) on 3 consecutive days. The tool allows patients to document meal sizes and energy levels and to comment on their SMBG experiences. (common to all groups and was the comparison condition). The CDSS developed to produce an automated analysis of a 3-day data period with medical. It is closely related to the self-monitoring tool and the content of an accompanying video on self-monitoring.</p> <p>Intervention arm 2 (CDSS+DVD): CDSS was developed to produce an automated analysis of a 3-day data period. It is closely related to the self-monitoring tool and the content of an accompanying video on self-monitoring. Plus, the Provider Education DVD program (Making Informed Therapy Decisions Using Structured SMBG) is a 28-min presentation that provides information about basic SMBG pattern management, identification of glycemic abnormalities, and use of SMBG data to initiate and adjust pharmacologic therapy.</p>	<p>Recommended treatment ordered/prescribed: Change in percentage of clinicians who correctly identified primary glycemic abnormalities and selected the most appropriate treatment option <u>F/U (time point unclear):</u> Comparison: 33% Int. Arm 1: 49% Int. Arm 2: 55%</p> <p>Absolute percentage point change (Int. Arm 1): +16 pct pts (p<0.0001) Absolute percentage point change (Int. Arm 2): +22 pct pts (p<0.0001)</p> <p>>90% of DST and DST+DVD clinicians were satisfied with the CDSS (thought it provided clinically useful info and enhanced interpretation of the SMG data);</p>	<p>Applicability: From this study it is difficult to generalize findings since little information is provided on setting and location; study is based on case studies; CDSS is not compared to “real world” practice; and time duration is unclear.</p> <p>Summary: The study reports that a higher proportion of primary care clinicians chose appropriate treatment for diabetes when provided with a CDSS alone and in combination with an educational DVD than the use of a patient self-monitoring tool for blood glucose alone. However, findings are difficult to generalize since the study did not involve real patient encounters and the time period of the intervention is unclear.</p>

Study	Study and Sample Characteristics	CDSS/KMS Intervention Characteristics	Results	Applicability and Summary
<p>The study is described as a “2 month study” but no further details are provided. <u>Interpretation of Results:</u> <80% of enrolled clinicians had complete data available + No comparison of findings to “real world” performance makes generalizability difficult since patient encounters were simulated.</p>	<p>No actual patients but 30 case studies of patients with type 2 diabetes were used.</p> <p>Unit of allocation (if applicable): - Clinician</p> <p>User level of expertise/proficiency/training (specify): Clinicians were excluded “if they currently used specialized structured testing data collection forms in their practice”. The decision support tool (DST) used in the study had a brief orientation video for clinicians.</p> <p>Patient Demographics: Not applicable since only patient cases were used in the study. Patients in all cases had type 2 diabetes and their HBA1C, age, ethnicity, height, weight, BMI, duration of diabetes, current meds, patient-reported information regarding disease management were available to clinicians in the study.</p>	<p>Evidence-based guidelines incorporated into CDSS: Can’t Tell – an expert panel of 3 was constituted to decide on appropriate action for the case studies but the authors also briefly refer to what might be more standard practice guidelines</p> <p>Other interventions delivered: A third intervention arm with just the DVD was also implemented (outside the scope of this abstraction).</p> <p>Source/origin of system: - Commercially available</p> <p>Content: Objective(s): - Pharmacotherapy - Chronic disease management Relationship to point of care: Not applicable since there were no actual patients.</p> <p>Response requirement: - NR (unclear whether response requirement)</p> <p>Information delivery: Delivery format: Can’t Tell</p> <p>Delivery mode: Can’t Tell</p> <p>Contextual factors/features influencing the implementation and use of CDSS included in CDSS: General System Features: none</p> <p>Clinician-System Interaction Features: No need for additional clinician data entry</p> <p>Communication and content features: Provision of a recommendation, not just an assessment</p>	<p>See Previous</p>	<p>See Previous</p>

<p>Study Authors (Year): Schnipper, Linder, Palchuk, et al. (2010)</p> <p>Study Focus: Diabetes management</p> <p>Suitability of design: Greatest</p> <p>Quality of Execution: Fair (2 limitations)</p> <p>Limitations: <u>Interpretation of Results:</u> Groups not comparable (percentage female, white) + low exposure of CDSS to intervention group</p>	<p>Geographical location: Eastern Massachusetts</p> <p>Study dates: March 2007 – September 2007; practices received CDSS (“Smart Form”) on a rolling basis</p> <p>General setting: Academic</p> <p>Specific setting: - Outpatient</p> <p>Study design: RCT</p> <p>Duration of ongoing intervention: 1 month for outcomes. 9 months for ongoing intervention.</p> <p>Sampling Frame (specify): - <u>Individual health care providers</u> (N=239): primary care physicians recruited from 10 clinics that used EHR; randomly assigned to study group or usual care. - <u>Patients</u> had either</p>	<p>Basic description of system: The CAD/DM Smart Form is a documentation-based CDSS that the clinician has to open and choose to use within an existing EHR; the Form integrates patient demographic and clinical data with rule-based logic derived from guidelines for management of CAD and DM; output includes assessments of current state of clinical care and suggested orders for medication additions or changes, lab studies, appointments., referrals, and printing of patient education materials.</p> <p>Evidence-based guidelines incorporated into CDSS: Yes, but not specified.</p> <p>Other interventions delivered: NR</p> <p>Source/origin of system: -locally developed Content: Objective(s): - Chronic disease management (diabetes) - Pharmacotherapy - Lab ordering</p>	<p>Recommended Preventive Care Ordered/Completed: Up-to-date BP result documented within 30 days of patient visit among those with a deficiency: CAD and DM patients: <u>F/U (4.5m)*[ITT]:</u> Comparison (n=1275): 23.8% Intervention (n=1232): 31.7% Absolute percentage point change: +7.9 pct. pts. (p>0.05)</p> <p>Smoking status documented within 30 days of patient visit: CAD and DM patients: <u>F/U (4.5m)[ITT]:</u> Comparison (n=5887): 2.9% Intervention (n=6600): 2.7% Absolute percentage point change: -0.2 pct. pts. (p>0.05) Recommended Clinical Test ordered/completed: Up-to-date LDL-C result documented within 30</p>	<p>Applicability: From this study, mainly to primary care practices within a large academic center with a well-established EHR in place looking to incorporate CDSS. Generalizability is limited by low exposure to clinicians in intervention group. A higher proportion of addressed deficiencies was found for patients who were male, Hispanic, had private insurance, and had fewer visits per year.</p> <p>Summary: Researchers found that the use of a documentation-based clinical decision support incorporated within an existing EHR system led to a statically significant improvement in addressing deficiencies related to care of patients with diabetes (and CAD)</p>

They note that the overall use of the CDSS was low (<6% of eligible patients). Reasons for low use were likely related to usability and provider satisfaction. Results were more pronounced when comparing patient visits where the CDSS was used vs. patient visits where the CDSS was not used (regardless of study group).</p>
