Summary of Community Preventive Services Task Force Recommendation

The Community Preventive Services Task Force (CPSTF) recommends lifestyle interventions delivered during the first two trimesters of pregnancy to reduce the risk of gestational diabetes.

The CPSTF finds strong evidence of effectiveness for lifestyle interventions that provide supervised exercise classes, either alone or in combination with other components. The CPSTF finds sufficient evidence of effectiveness for lifestyle interventions that provide education and counseling for diet or physical activity, diet activities, or a combination of these components.

Major Findings

The CPSTF recommendation is based on evidence from 29 studies identified in a systematic review published in 2016.¹

- Compared to usual care, lifestyle interventions reduced the overall risk of developing gestational diabetes by 32%.
  - Interventions that provided supervised exercise classes alone or in combination with other lifestyle reduced the risk by 32%.
  - Interventions that provided education and counseling for diet and physical activity reduced the risk by 31%.

What are lifestyle interventions to reduce gestational diabetes risk?

Lifestyle interventions delivered during the first two trimesters of pregnancy aim to prevent gestational diabetes by actively encouraging women to eat a healthy diet and be physically active. Programs include one or more of the following components:

- Supervised exercise classes
- Diet education and counseling
- Physical activity education and counseling
- Diet activity (e.g., meal plan, food diary, individualized support)

Facts about Gestational Diabetes

- Every year, 6% to 9% of pregnancies in the United States are affected by gestational diabetes.²
- About half of all women who develop gestational diabetes are likely to develop type 2 diabetes later in life.³
- Babies whose mothers have gestational diabetes are at higher risk of being born early, having low blood sugar, and developing obesity later in life.³
